NOVA VCS Product Overview

Gaining the public's acceptance is pivotal to a successful road safety program. This acceptance involves providing the public with open, yet secure access to information to support an investigation of a traffic camera offence.

Tenix Solutions presents NOVA VCS, a Viewer Certificate System. NOVA VCS is a robust and secure platform enabling the public to view original evidence from traffic camera systems.

NOVA VCS sources the original, encrypted evidence file to obtain traffic camera images and associated data pertaining to an infringement.

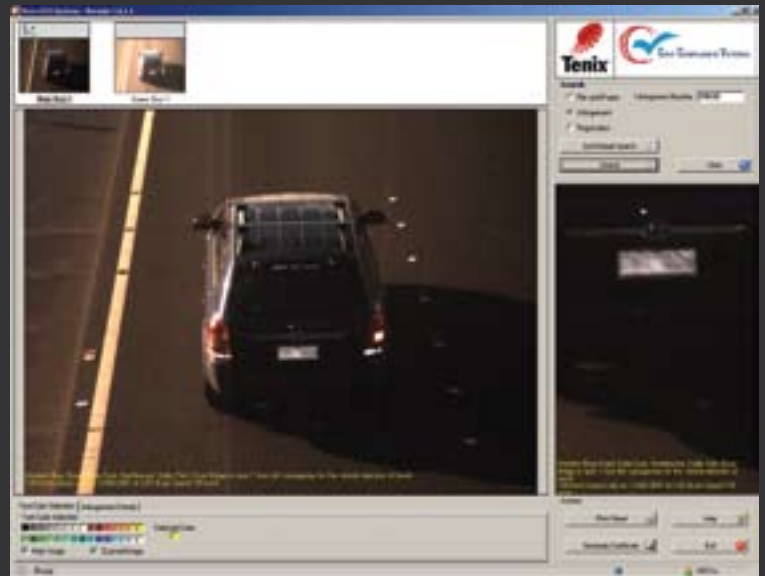

NOVA VCS – A Snapshot

- Simultaneously interfaces to multiple evidence systems to retrieve original evidence for viewing
- Displays infringement images on a computer monitor for viewing
- Presents images from multiple camera types in a consistent manner
- Applies zoom coordinates stored in the Evidence Processing System to produce a number plate image and overall incident scene
- Prints both the scene and number plate image on a certificate
- Complies with international guidelines for the management of evidence.

Protection of Evidence

NOVA VCS uses web services to request and retrieve the original evidence file for viewing, restricting access to the original evidence storage system. This ensures that only authorised personnel have access to the primary evidence store.

Below is an example of NOVA VCS image presentation.

Court Certificates

NOVA VCS has been designed to produce court certificates displaying both scene and number plate shots that can be verified by an authorised representative for use as evidence in court. This removes the need for expensive equipment to be transported to court for the production of evidence.
